

Procedures 2

Procedures are stored sets of commands that can be named and then run at any time to save you writing the same instructions over and over again.

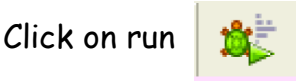

Parameters can be given to procedures which are defined each time the procedure is run. For example, by making the parameters for a procedure the number of sides to draw for a polygon, each time the procedure is run the number of sides the shape has can be changed.

Click **Edit**. The 'Create a procedure' window will close and the **procedure editing window** will open.

Type your commands between the brackets.

Enter number of sides
